

Sensitivity / Robustness

We evaluate robustness of Adirondak trails suitability analysis. The top-right map is the suitability map for hiking trails in part of Adirondak in terms of slope, height and view (Original). The bottom-right map shows the mean value of 30 variations of weight combination around the original one (Mean). The bottom-left is a map illustrating the coefficient of variance (CV).

The original and mean suitability layers show nearly identical spatial patterns. The CV layer indicates that variability is generally low with most CV values below 15%. This suggests that the model outputs are stable and robust, and that the weighting assumptions are already well-calibrated. Further adjustment of weights would likely have minimal impact on the final results.
